OVER SEEDING

THICKER, GREENER, HEALTHIER LAWNS NATURALLY!

WHY OVER SEED?

Over seeding is a great way to help fill in thin areas, improve lawn density and keep your lawn looking its best. It's also the best way to introduce new, improved grass varieties like Kentucky Bluegrass and Perennial Ryegrass that offer better color, drought tolerance and disease resistance.

WHAT IS OVER SEEDING?

Over seeding is planting grass seed directly over the existing turf after core aeration is completed. The aeration holes create room for the new seed to get under the soil surface, resulting in new grass growth and a thicker, healthier lawn.

WHEN TO OVER SEED?

Over seeding should be done during fall: September 1st – October 15th or in Spring: March 1st – April 30th. Weather conditions may extend or shorten the ideal timing.

AFTER OVER SEEDING CARE

Keep the area moist by watering daily. If kept moist, seed will come up quickly and evenly. After three weeks, water less frequently but more deeply. Continue to fertilize and avoid using weed controls until the new grass has been mowed at least four times. Be patient and remove weeds after the turf has matured.

THE BENEFITS OF OVER SEEDING

THICKER LAWN
Fills in thin areas and increases lawn density.

BETTER COLOR
New, improved varieties provide a darker, greener lawn.

MORE RESISTANT
Improved drought, disease and insect tolerance.

HEALTHIER LAWN
Creates a lush, thick lawn that naturally out-competes weeds.
