Meehan's Brookside LAWN SERVICE

REDUCING MOLE DAMAGE

Protect your lawn from tunnels, mounds, and hidden damage.

WHY MOLES DAMAGE LAWNS

Mole activity can cause considerable damage to lawns. Damage often appears as tunnels and mounds that are unsightly, disturb root systems, and create travel lanes or cover for other small mammals.

IMPORTANT TO KNOW

Moles are insectivores, meaning they eat insects. Because of that, grain poison products are generally useless for controlling moles. Many home remedies have also proven ineffective according to university studies.

CONTROL OPTIONS

According to The Ohio State University, trapping is an effective and practical way to control moles. Although effective, it requires an investment in traps and effort. Trapping success is usually best in the spring and fall. Traps can often be purchased online or through local farm supply stores.

MEEHAN'S MOLE CONTROL PROGRAM

Our mole control treatment is 100% organic and completely safe for children, pets, and plants. Treatments are not expected to stop all mole activity immediately, but they help make your yard an unfavorable place for moles to feed.

Best trapping success: Spring & Fall

HOW IT WORKS

Moles come up toward the surface to feed and, because they have very poor sight, they rely heavily on their sense of smell to locate insects. Our mole control treatment has an unappealing smell to moles, but no detectable odor to humans, making it an easy and safe way to help repel moles from your property.

PROGRAM DETAILS

Our Mole Control consists of a six-application program applied during optimal conditions to help repel moles. Treatments are made during scheduled mole control visits.
