Meehan's Brookside LAWN SERVICE

SUMMER TREATMENT FREQUENTLY ASKED QUESTIONS

1 AT WHAT HEIGHT SHOULD I BE MOWING MY GRASS?

You should be mowing your lawn at 3½" or higher! This is usually the highest setting on the mower. A proper cut will tolerate dry spells better, allow fewer weeds to germinate, and harbor less turf damaging insects.

2 IS IT TOO HOT AND DRY TO FERTILIZE?

Although hot and dry weather is stressful on turf, it is important to continue feeding the lawn, treating weeds as they appear, and inspecting for turf damaging insects. The fertilizer will remain in place so it will be washed into the soil when it does rain.

3 DO I NEED TO WATER IN TODAY'S TREATMENT?

You can water in the application, but it is not necessary. The fertilizer will remain until the dew or rain dissolves the fertilizer and allows i it to feed the grass naturally through the roots. Watering is a great idea when we do not receive adequate rain.

4 WHAT IS THE LIGHT GREEN GRASS GROWING IN MY LAWN?

During the spring it is common to see lighter patches of grass as the different varieties of turf can be slightly different colors during rapid growth periods. During the summer, light colored grass that suddenly appears may be Nutsedge or Crabgrass. During our visits we are inspecting for and treating these if they are present.

5 WILL THIS TREATMENT KILL MY WEEDS?

Yes! On today's visit we will treat any broadleaf weeds that are present. There are many weed types that don't germinate until summer. These are called summer annuals and will be treated on this visit.

6 I HAVE FOUND A TICK ON MY DOG. WILL THE LAWN TREATMENTS TAKE CARE OF FLEAS AND TICKS?

Your regular treatments do not take care of Fleas, Ticks or Ants. We do have a very effective Flea, Tick, and Ant Treatment that lasts about 30 days that can be done as a prevention or a remedy once you have a problem. The cost is about the same as your regular treatment. Call the office for exact pricing and to schedule your treatment!
