Meehan's Brookside LAWN SERVICE

WHEEL TRACKS

LEFT ON THE TURF

WHAT ARE WHEEL TRACKS?

Wheel tracks arethe marks left in the lawn from mowers, fertilizer spreaders, or other equipment. The grass where the wheels (or feet) have passed over often turns brown, white, or tan and can look dead.

WHAT CAUSES WHEEL TRACKS?

The tires or wheels compact the soil, restricting air, water and nutrients from reaching the grass roots. The grass is then stressed, especially during hot, dry conditions, and can go dormant. In some cases, the tracks may turn brown and appear dead.

HOW TO HELP WHEEL TRACKS?

The best approach is time and proper care. Keep the lawn well watered, follow a regular fertilization program, and allow the grass time to recover. In most cases, the grass will gradually fill in and the tracks will fade within a few weeks as the grass grows and repairs itself.

OTHER TIMES WHEEL TRACKS OCCUR

Tracks are more likely to occur when the lawn is wet, soft, or frozen. Foot traffic, service equipment, and even vehicles can leave ruts in these conditions. Avoid driving or operating equipment on the lawn during these times to prevent long-lasting damage.
